

Find a Clean Path

The lake where I love to swim and play is becoming polluted with litter. **Draw a path the raindrop can take to reach the lake without collecting microlitter along the way.**

Litter creates big problems for the water that all plants, animals, and people need to survive — including me! For example, rainwater makes puddles and the litter left behind begins to float. It moves along until it flows into the nearest bayou, stream, river, swamp, or canal — these areas are part of a **watershed**. Big litter that's easy to see is bad, but even worse is the **microlitter** (smaller than the size of a Mardi Gras bead—5mm) because it mixes with the water and can never be cleaned up.
